## JOB MARKET PAPER

**Worker Bargaining Power and Market Tightness: Theory and Evidence**

*Abstract.* What determines worker bargaining power? This paper argues that bargaining power is an equilibrium outcome of labour market conditions: when alternative employers are easier to find, a worker's threat to walk away from a negotiation becomes credible, and the worker's bargaining power rises. I formalise this intuition in a bargaining model in which workers and firms keep searching while they negotiate. In equilibrium, bargaining power is strictly increasing in labour market tightness. The model delivers an empirical counterpart: bargaining power is the pass-through of match productivity into wages, which should therefore rise with tightness. Using French matched employer-employee data and measures of local labour market tightness, I find that a one-euro increase in the hourly marginal product of labour raises the hourly wage by 3.3 cents at average tightness and by 3.7 cents one standard deviation above it, a 13% increase in pass-through.
